

MMP100 Final

While taking introduction to Multimedia we went over various forms of multimedia such as digital imaging, audio, animation, and web development, and programming. For my final project, I wanted to create something that I found challenging but yet exciting to learn. I decided to create an animation using adobe After Effects and Adobe Illustrator. The animation tells a simple story of the current pandemic and how I miss exploring.

I first started by brainstorming my ideas, and creating a storyboard to expand my thoughts as a rough draft. I then started Adobe Illustrator to start drawing the components needed for my animation. In my animation I drew a city, the sun, and a mask covering the sun, a nightstand, my smartphone, a desk, calendar, and computer. Once I had my components drawn, I imported the images onto Adobe After Effects. By placing the images on the exact position of where I would want the image to appear on the timeline I then added animated transform effects such as position, scale, and opacity. Additionally, I imported some videos I recorded on my own as a way to reflect on what I miss doing, which is traveling and exploring.

Creating animation is fun however, the work is tedious. The most challenging part was having to draw the components, then positioning it to exactly where I would like it to be so that the images can animate the way I would like it to.
